

QA Engineer

Position Summary:

DotLoop is looking to immediately hire QA Engineers to join their growing Engineering organization. This is an outstanding opportunity for experienced web application QA Engineers to join a fun, creative, and challenging environment. DotLoop is the leading provider of simple, paperless Real Estate solutions that takes a complex process and makes it simple. Real Estate agents, brokers, buyers, and sellers are using DotLoop to save time, money and hassle. DotLoop's system is used across the country to facilitate more convenient and efficient transactions, to provide better information to the brokers and their agents and generally provide a better process for everyone involved.

We're looking for a self-motivated, innovative problem solver who makes the things happen. Experience is important but equally valuable is the ability to work in a fast paced, dynamic environment to ensure that our solutions meet the defined requirements and make our users' lives easier. This position is focused on development of test environments, development and execution of test plans, maintaining test automation and developing new test automation for our solutions.

Position Requirements:

- Experience with MySQL, comparable SQL database is a plus.
- Experience with the Agile development methodology.
- Apache, Tomcat, experience is a plus.
- Passionate about web technologies and UI innovations.
- Experience with creating, reviewing and challenging requirements.
- Experience designing and implementing test plans.
- Strong analytical and problem solving skills.
- Ability to adapt and quickly refocus in an agile software development environment.
- Excellent communication skills, both oral and written.
- Ability to understand the features and customer expectations of assigned responsibilities.
- Ability to understand architecture of assigned product.

Principal Responsibilities:

- Participates in the creation and review of new product requirements. Provides constructive feedback about the consistency and depth of the requirements.
- Identifies tests that are necessary as a result of the requirements to ensure a high-quality product.
- Identifies tests that are most appropriate for automation, creates and maintains both automated and manual tests, and applies techniques that insure maintainable test assets.
- Defines, develops and executes test strategies considering risk and cost of testing.
- Supports the creation of project plans and activities that track progress against those plans.
- Creation of and execution of test plans.
- Creation of test case library.
- Definition of regression test suite.
- Work with development engineers to identify and resolve defects.
